and Martin Mevissen

Metallic optical nanoresonators

Enhance and concentrate the optical near fields to small regions

Au

Au

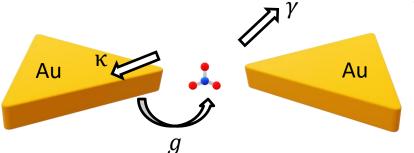

Metallic optical nanoresonators

Enhance and concentrate the optical near fields to small regions

g: Coupling strength

 γ : Radiation losses

к: Nanoantenna losses

This system can be described by

$$\widehat{H} = \hbar \omega_c \widehat{a}^{\dagger} \widehat{a} + \hbar \frac{\omega_0}{2} \widehat{\sigma}_z + \hbar g (\widehat{\sigma}_+ \widehat{a} + \widehat{\sigma}_- \widehat{a}^{\dagger})$$

 \hat{a}^{\dagger} : Creation operator

 $\hat{a}:$ Annihilation operator

 $\hat{\sigma}_+, \hat{\sigma}_-, \hat{\sigma}_z$: Pauli operators

Metallic optical nanoresonators

Au K Au

Enhance and concentrate the optical near fields to small regions

g: Coupling strength

 γ : Radiation losses

κ: Nanoantenna losses

This system can be described by

$$\widehat{H} = \hbar \omega_c \widehat{a}^{\dagger} \widehat{a} + \hbar \frac{\omega_0}{2} \widehat{\sigma}_z + \hbar g (\widehat{\sigma}_+ \widehat{a} + \widehat{\sigma}_- \widehat{a}^{\dagger})$$

The system can reach the strong coupling regime

Vincenzo Giannini et al. *Chem. Rev.* 373, 111, 6, 3888 – 3912 (2011) Francisco J. Garcia-Vidal et al. *Science eabd0336* (2021).

Strong coupling criteria

$$\frac{\kappa + \gamma}{\Delta} < g$$

 \hat{a}^{\dagger} : Creation operator

 \hat{a} : Annihilation operator

 $\hat{\sigma}_+, \hat{\sigma}_-, \hat{\sigma}_z$: Pauli operators

Extension to include more molecules

$$\widehat{H} = \hbar \omega_c \widehat{a}^{\dagger} \widehat{a} + \hbar \sum_{j} \frac{\omega_{0,i}}{2} \widehat{\sigma}_{z,j} + \hbar \sum_{j} g \left(\widehat{\sigma}_{+,j} \widehat{a} + \widehat{\sigma}_{-,j} \widehat{a}^{\dagger} \right)$$

The study of these systems can be useful in molecular sensing and spectroscopic techniques, and also possibly in polaritonic chemistry

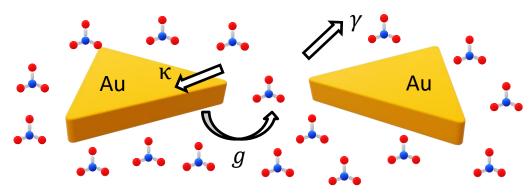

Tomáš Neuman, et. al. J. Phys. Chem. C. 119, 26652, (2015). Govind Dayal, et. al. J. Phys. Chem. Lett. 12, 3171, (2021). Marta Autore, et. al. Light: Science & Applications 7, 17172, (2018). Thomas W. Ebbesen. Acc. Chem. Res. 49, 2403, (2016). James T. Hugall, et. al. ACS Photonics, 5, 43, (2018).

Extension to include more molecules

$$\widehat{H} = \hbar \omega_c \widehat{a}^{\dagger} \widehat{a} + \hbar \sum_{j} \frac{\omega_{0,i}}{2} \widehat{\sigma}_{z,j} + \hbar \sum_{j} g \left(\widehat{\sigma}_{+,j} \widehat{a} + \widehat{\sigma}_{-,j} \widehat{a}^{\dagger} \right)$$

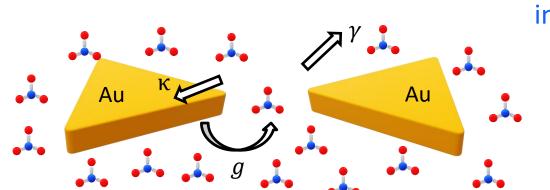

The study of these systems can be useful in molecular sensing and spectroscopic techniques, and also possibly in polaritonic chemistry

Tomáš Neuman, et. al. J. Phys. Chem. C. 119, 26652, (2015). Govind Dayal, et. al. J. Phys. Chem. Lett. 12, 3171, (2021). Marta Autore, et. al. Light: Science & Applications 7, 17172, (2018). Thomas W. Ebbesen. Acc. Chem. Res. 49, 2403, (2016). James T. Hugall, et. al. ACS Photonics, 5, 43, (2018).

Extension to include more molecules

Simulations become very demanding in classical computers

Explore the implementation of these systems in a quantum computer

$$\widehat{H} = \hbar \omega_c \widehat{a}^{\dagger} \widehat{a} + \hbar \sum_{j} \frac{\omega_{0,i}}{2} \widehat{\sigma}_{z,j} + \hbar \sum_{j} g \left(\widehat{\sigma}_{+,j} \widehat{a} + \widehat{\sigma}_{-,j} \widehat{a}^{\dagger} \right)$$

The study of these systems can be useful in molecular sensing and spectroscopic techniques, and also possibly in polaritonic chemistry

Example of 5 quantum emitters and 6 plasmonic states

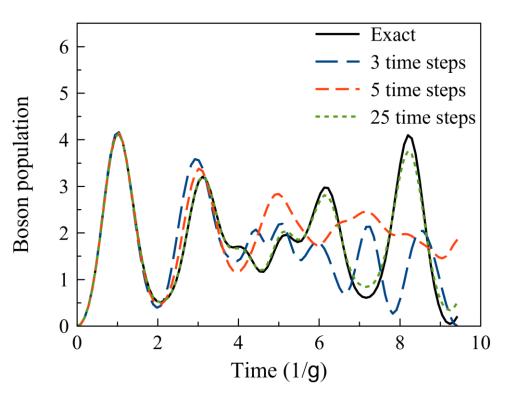

- : Qubits that describe the quantum emitter
- : Qubits that describe the plasmon

2-qubit Depth =
$$(N_{qubits} - N_{QE} - (N_P - 2))(N_{QE} - 1)(N_{steps} + 32N_{QE},N_{steps})$$

This equation scales linearly with the number of the quantum emitters and the number of time steps

Automatic circuit

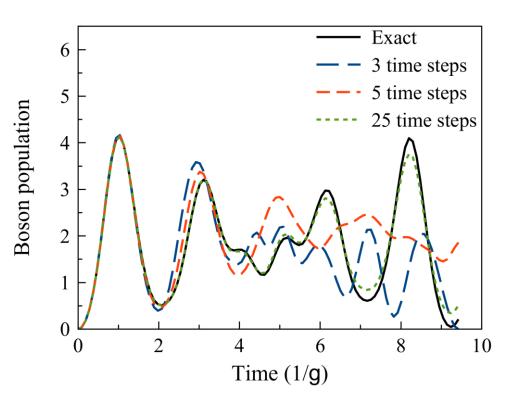

For 1 time step: 2-qubit depth = 208

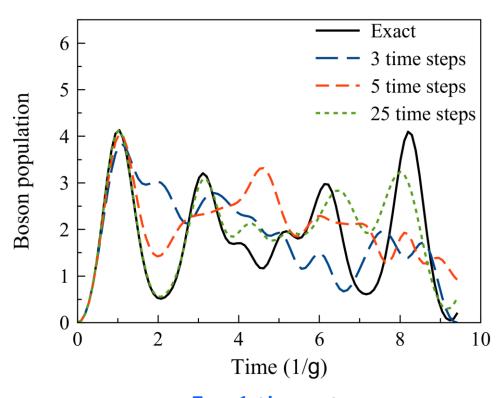

Automatic circuit

For 1 time step: 2-qubit depth = 208

Parallelize circuit

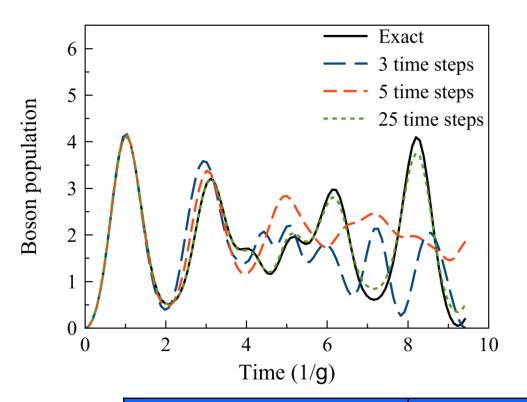

For 1 time step: 2-qubit depth = 160

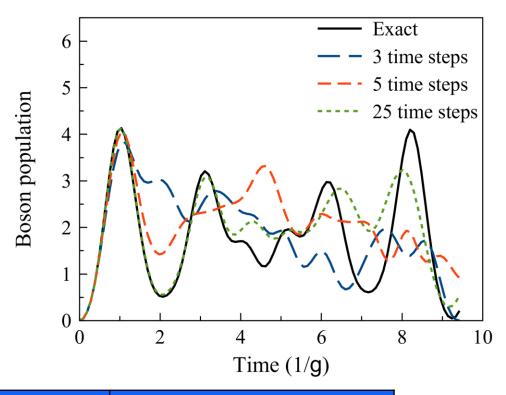

Automatic circuit

Parallelize circuit

	Quantum emitters	Automatic circuit 2-qubit depth	Parallelize circuit 2-qubit depth	
	5	208	160	
	7	304	224	Ī
	10	448	320	E
: 2	15	688	480	Jä

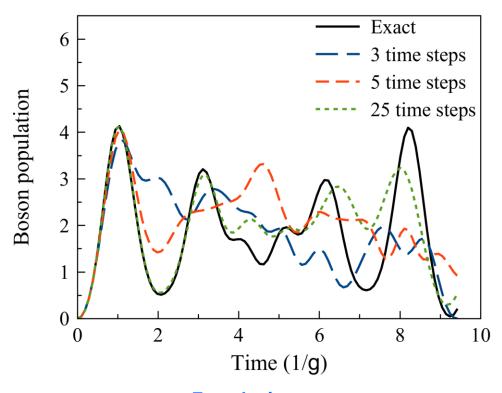

BasQ Qiskit Fall Fest

Automatic circuit

For 1 time step: 2-qubit depth = 208

Parallelize circuit

For 1 time step: 2-qubit depth = 160

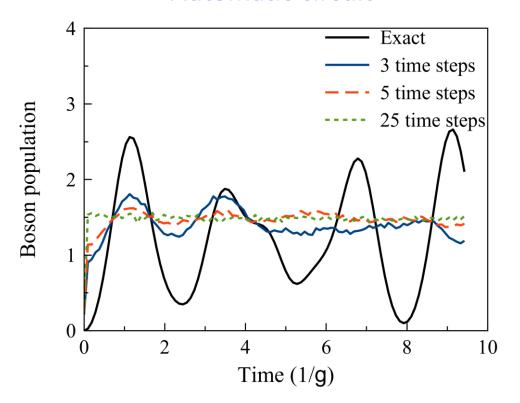

Quantum simulation with IBM Torino

Quantum simulation with 3 molecules

Estimator primitive: We have used a resilience level 2 and optimization level 1

Automatic circuit

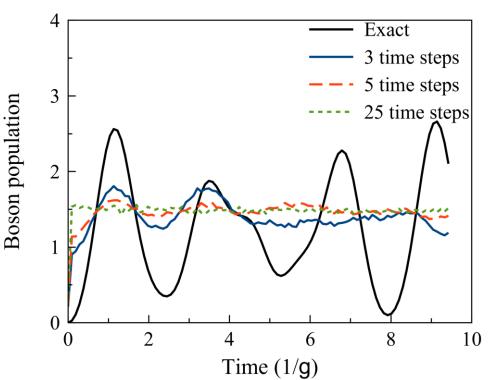

Quantum simulation with IBM Torino

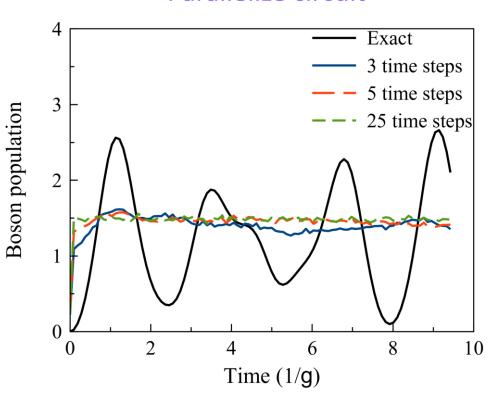

Quantum simulation with 3 molecules

Estimator primitive: We have used a resilience level 2 and optimization level 1

Automatic circuit

Parallelize circuit

Quantum simulation becomes very demanding

We want to implement the Qiskit Addons Multi-Product Formula (MPF) to obtain lower trotter errors

Conclusions

We have implemented the Jaynes-Cumming Hamiltonian in a quantum circuit.

- Excellent agreement with the exact results.
- We observe three clear Rabi oscillations.
- We have extended the model to include more quantum emitters
 - We obtain very deep circuits.
 - Linear scaling with the number of emitters and time steps.

An interesting finding

The terms of the Hamiltonian do **not commute**. However, for zero detuning $\Delta = \omega_0 - \omega_c = 0$

$$\hbar\omega_c\hat{a}^{\dagger}\hat{a} + \hbar\frac{\omega_0}{2}\hat{\sigma}_{z'}$$
 Rotating frame

Further, if we write the remaining terms in the order

$$\begin{split} \hbar g \left(\hat{\sigma}_{-}^{\text{(QE)}} \hat{a}^{\dagger} + \hat{\sigma}_{+}^{\text{(QE)}} \hat{a} \right) &= \frac{\hbar g}{4} \left[\hat{\sigma}_{x}^{\text{(QE)}} \hat{\sigma}_{x}^{1} \hat{\sigma}_{x}^{0} + \hat{\sigma}_{x}^{\text{(QE)}} \hat{\sigma}_{y}^{1} \hat{\sigma}_{y}^{0} + \hat{\sigma}_{y}^{\text{(QE)}} \hat{\sigma}_{x}^{1} \hat{\sigma}_{x}^{0} - \hat{\sigma}_{y}^{\text{(QE)}} \hat{\sigma}_{x}^{1} \hat{\sigma}_{y}^{0} + \right. \\ \sqrt{2} \hat{\sigma}_{x}^{\text{(QE)}} \hat{\sigma}_{x}^{2} \hat{\sigma}_{x}^{1} + \sqrt{2} \hat{\sigma}_{x}^{\text{(QE)}} \hat{\sigma}_{y}^{2} \hat{\sigma}_{y}^{1} + \sqrt{2} \hat{\sigma}_{y}^{\text{(QE)}} \hat{\sigma}_{y}^{2} \hat{\sigma}_{x}^{1} - \sqrt{2} \hat{\sigma}_{y}^{\text{(QE)}} \hat{\sigma}_{x}^{2} \hat{\sigma}_{y}^{1} + \sqrt{3} \hat{\sigma}_{x}^{\text{(QE)}} \hat{\sigma}_{x}^{3} \hat{\sigma}_{x}^{2} + \sqrt{3} \hat{\sigma}_{x}^{\text{(QE)}} \hat{\sigma}_{y}^{3} \hat{\sigma}_{y}^{2} + \sqrt{3} \hat{\sigma}_{y}^{\text{(QE)}} \hat{\sigma}_{y}^{3} \hat{\sigma}_{x}^{2} - \sqrt{3} \hat{\sigma}_{y}^{\text{(QE)}} \hat{\sigma}_{x}^{3} \hat{\sigma}_{y}^{2} \right] \end{split}$$

We find zero trotterization error

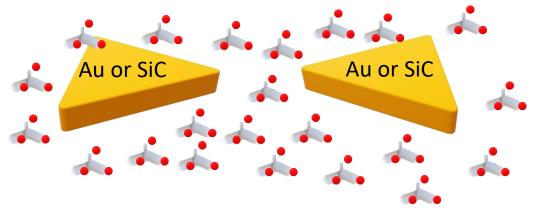

PRELIMINARY EXPLANATION

Terms $\{H_1, H_2, H_3, H_4\}$ commute, as well as $\{H_5, H_6, H_7, H_8\}$ terms and $\{H_9, H_{10}, H_{11}, H_{12}\}$ terms. $H_5 + H_6 + H_7 + H_8$ commute with $H_1 + H_2 + H_3 + H_4$ and $H_9 + H_{10} + H_{11} + H_{12}$. $H_1 + H_2 + H_3 + H_4$ 'almost commutes' with $H_9 + H_{10} + H_{11} + H_{12}$ (the result applied to any plasmonic state gives zero)

$$e^{-iHt} = e^{-i(H_1 + H_2 + H_3 + H_4 + H_5 + H_6 + H_7 + H_8 + H_9 + H_{10} + H_{12} + H_{12})t} = e^{-i(H_1 + H_2 + H_3 + H_4)t}e^{-i(H_5 + H_6 + H_7 + H_8)t}e^{-i(H_9 + H_{10} + H_{12} + H_{12})t} = e^{-iH_1t}e^{-iH_2t}e^{-iH_3t}e^{-iH_4t}e^{-iH_5t}e^{-iH_6t}e^{-iH_7t}e^{-iH_8t}e^{-iH_9t}e^{-iH_{10}t}e^{-iH_{11}t}e^{-iH_{12}t}$$

Basque Quantum

Scaling

$$\left(N_{qubits} - N_{QE} - (N_{Fock} - 2)\right)\left(N_{QE} - 1\right)N_{steps} + 32N_{QE}N_{steps}$$
